

Go on the Offense Against White Mold with Double-Team Defense

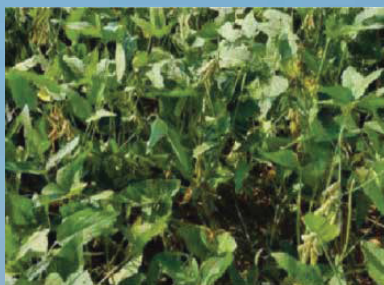

ACROPOLIS® Fungicide

ACROPOLIS® Fungicide brings two effective modes of action for the control of white mold infestations in soybeans.

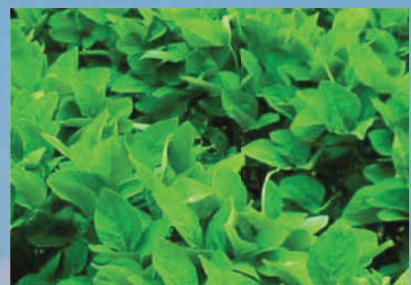

Featuring two modes of action to prevent and arrest early infection in-plant, ACROPOLIS helps stop the establishment of white mold in soybeans. The consistency of performance and crop safety of ACROPOLIS has been excellent in 2017 research trials.

ACROPOLIS — The Power in Soybean Fungicides

ACROPOLIS brings two effective modes of action for the control of white mold infestations in soybeans.

ACROPOLIS combines two top-rated active ingredients: tetraconazole and thiophanate-methyl. In 2017 trials, ACROPOLIS provided substantial disease reduction of white mold, delivering yield benefits over untreated control and competitive standards. Locally systemic, ACROPOLIS provides crop-safe control of white mold for up to 21 days. In most situations, one well-timed application of ACROPOLIS can control moderate to heavy infestations of white mold.

ACROPOLIS Rate for White Mold in Soybeans (23 fl oz/A)

- Apply at early bloom (R1 soybean growth stage)
- Make a 2nd application after 14 days when environmental conditions are favorable to continued disease development
- Apply a minimum of 10 gallons of spray suspension per acre by ground sprayer or in a minimum of 5 gallons of spray suspension per acre by aircraft
- Full coverage of the flowers, stems and branches is required for disease control
- ACROPOLIS label allows two applications per season
- In addition to white mold, ACROPOLIS also controls: anthracnose, brown spot, frog-eye leaf spot, purple seed stain, pod and stem blight, powdery mildew and Asian soybean rust; refer to the label for application and use rates

“We could even tell to the row by plant color and height the difference between the ACROPOLIS treated soybeans and the untreated soybeans.”
